Mock Interview

1) Suppose you are working on an industrial monitoring system. How would you see use Bayesian Networks to predict machine failures.

A) A Bayesian network represents relationship b/w machine condition and failure variable use temperature, vibration and pressure are represented as nodes.

2) Imagine you are asked in an interview to design an denoising sol. How would Markov Random Field help model neighbourhood pixel.

A) An MRF's each image pixel as a node. Pixel is connected to its neighboring pixels. The neighbourhood information to identify noisy pixel.

3) suppose an interviewer, asks how conditional Independence simplified probabilistic Inference. How would you justify it with a graphical model example

A) conditional Independence two variable become independent when another variable is known. For example if disease causes fever and cough.

4) In a healthcare diagnosis problem, how would you compare directed graphical, models and undirected graphical models for representing symptom relationship.

A) Directed models use arrows to represent the relationships b/w the variable. A Bayesian network is best example. undirected models use connections without arrows
